

Surgical Sutures & Meshes

State of the art

When experience matters

Our surgical sutures are manufactured in line with state of the art technology. Each individual production process is subject to strict scientific quality control.

Continuous inspection of both mechanical and microbiological characteristics is given top priority. We have more than 85 years of experience in manufacturing surgical sutures.

Our team understands the specific needs of medical professionals by providing them with access to the most complete portfolio of surgical sutures. The result is the current modern product range of absorbable and non-absorbable sutures, which consists of more than 1500 individual surgical suture products.

Production takes place in accordance with GMP guidelines, and a comprehensive quality management system in line with ISO 13485 has been implemented.

All products have been CE marked since 1999.

Surgical Sutures - Absorbable threads

UK03
6

CHIRASORB rapid

Intended for use in Skin closure, Paediatric surgery, Episiotomies, Circumcision, Closure of oral mucosa and Ophthalmic surgery for conjunctival sutures.

Composition	Colour	Range	Characteristics
Braided and coated suture made from 90% glycolide and 10% L-lactide	Violet and Natural	6/0 to 2 USP	Absorbable, multifilament, coated, synthetic, high tensile strength, reduced capillary effect, short-term healing

CHIRLAC rapid

Intended for use in Gynaecology, Skin Closure, Ophthalmic, Odontology and Paediatric surgery.

Composition	Colour	Range	Characteristics
Braided and coated suture made of Polyglycolic acid (PGA)	Violet and Natural	6/0 to 4 USP	Absorbable, multifilament, coated, synthetic, high tensile strength, reduced capillary effect, short-term healing

MONOLAC

Intended for use in general soft tissue in all specialities, Skin Closure, Plastic, Gynaecology, Urology and Gastrointestinal surgery.

Composition	Colour	Range	Characteristics
Monofilament suture made of Glycolide and ϵ -caprolactone	Violet and Natural	6/0 to 2 USP	Absorbable, monofilament, synthetic, high tensile strength, excellent handling properties, mid-term healing

CHIRASORB

Intended for use in General surgery, Gynaecology, Ophthalmic, Skin Closure, Muscular layer and Ligation.

Composition	Colour	Range	Characteristics
Braided and coated suture made from 90% glycolide and 10% L-lactide	Violet and Natural	10/0 to 6 USP	Absorbable, multifilament, coated, synthetic, high tensile strength, reduced capillary effect, mid-term healing

CHIRASORB Plus

Antibacterial

Intended for use in General surgery, Gynaecology, Skin Closure, Muscular layer and Ligation.

Composition	Colour	Range	Characteristics
Antibacterial, braided and coated suture made from 90% glycolide, 10% L-lactide and chlorhexidine diacetate	Violet and Natural	6/0 to 4 USP	Absorbable, multifilament, anti-bacterial coating, synthetic, high tensile strength, reduced capillary effect, mid-term healing

CHIRLAC

Intended for use in General surgery, Gynaecology, Ophthalmic, Skin Closure, Muscular layer and Ligation.

Composition	Colour	Range	Characteristics
Braided and coated suture made of Polyglycolic acid (PGA)	Violet and Natural	9/0 to 6 USP	Absorbable, multifilament, coated, synthetic, high tensile strength, reduced capillary effect, mid-term healing

POLYDOX

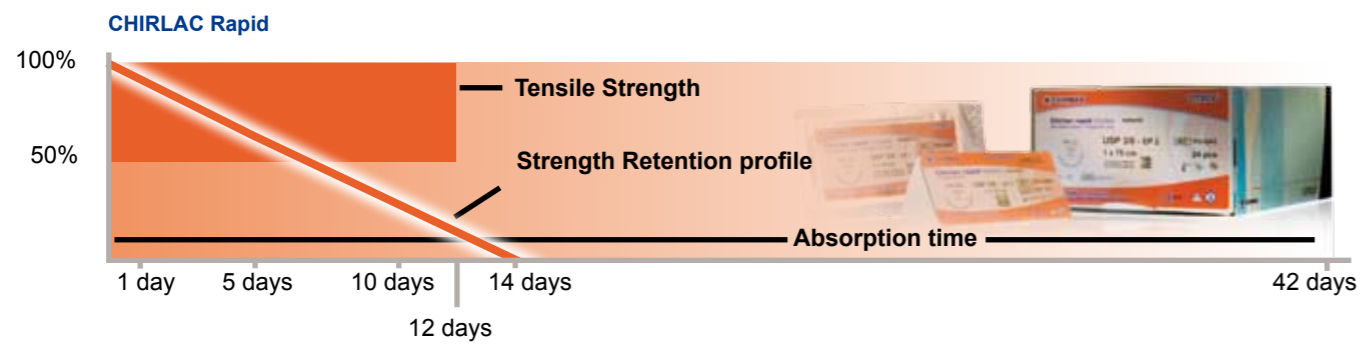

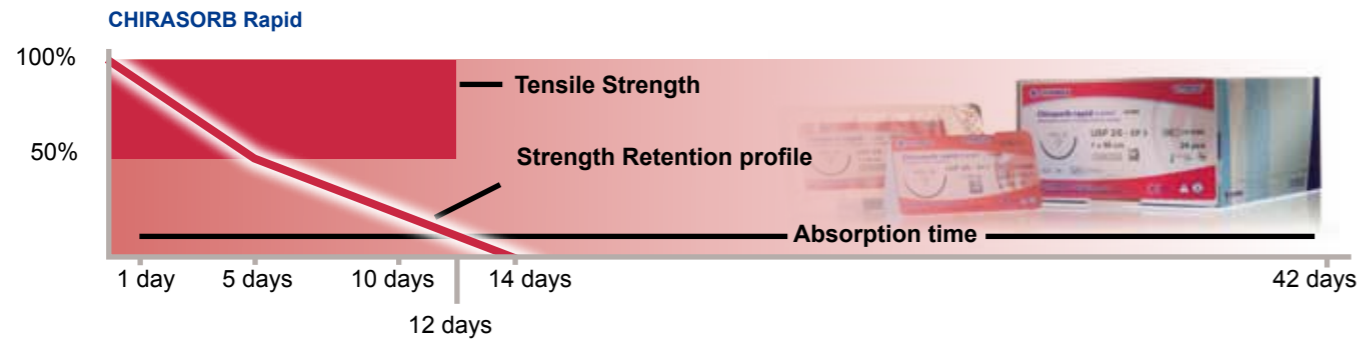

Intended for use in general soft tissue approximation, Orthopaedics, Fascia Closure, Urology, Gynaecology and Plastic surgery. Recommended for long-term healing.

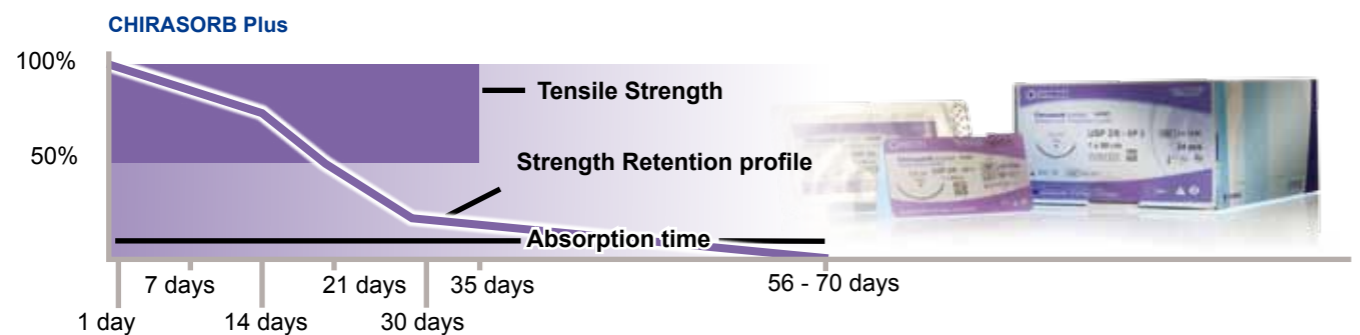

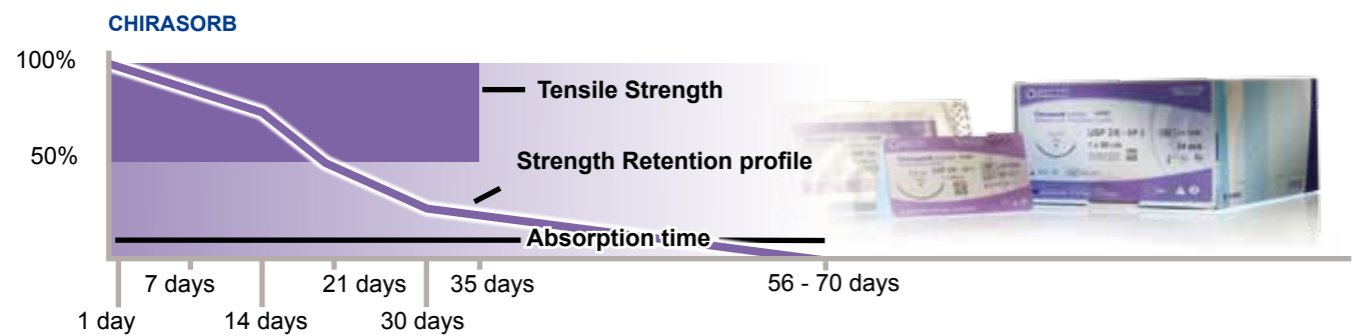

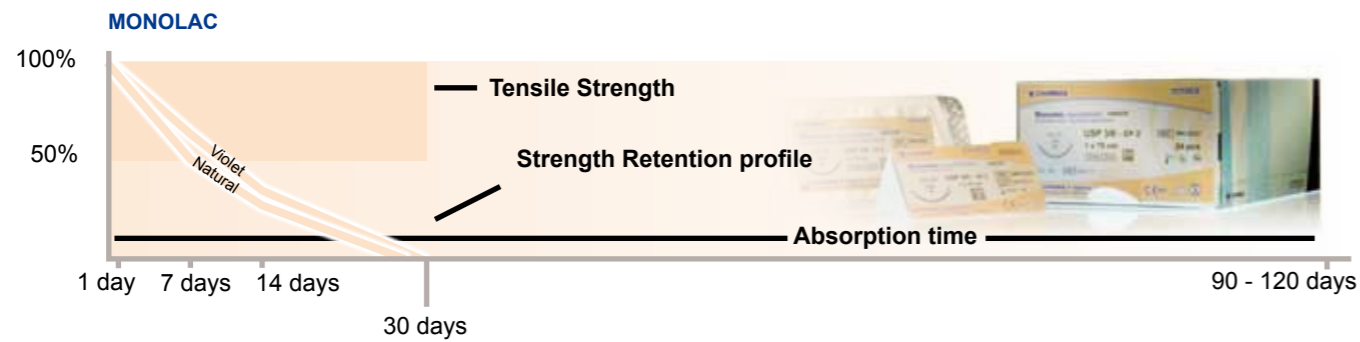

Composition	Colour	Range	Characteristics
Monofilament suture made of Poly-p-dioxanone	Violet and Natural	7/0 to 4 USP	Absorbable, monofilament, synthetic, high tensile strength, excellent knotting properties, long-term healing

Surgical Sutures - Non-absorbable threads

CHIRAFLON

Intended for use in all surgical specialities, especially Cardiovascular, Plastic, Reconstructive, Ophthalmic, Orthopaedics and Traumatology (optimal, temporary, easily removable suture).

Composition	Colour	Range	Characteristics
Monofilament suture made of Polyvinylidene Fluoride (PVDF) - similar to Teflon	Blue	8/0 to 3 USP	Non-absorbable, monofilament, synthetic, no capillary effect, very smooth, excellent knotting properties, easy to handle, physiologically inert

CHIRALEN

Intended for use in all surgical specialities, especially Cardiovascular, Plastic, Reconstructive, Ophthalmic, Orthopaedics and Traumatology (tendons).

Composition	Colour	Range	Characteristics
Monofilament suture made of Polypropylene	Blue and Black	10/0 to 2 USP	Non-absorbable, monofilament, synthetic, no capillary effect, smooth, non-porous surface, suitable for stitches in infected wounds

SILON monofilament

Intended for use in Skin Closure, Plastic, Reconstructive, General and Ophthalmic surgery.

Composition	Colour	Range	Characteristics
Monofilament suture made of Polyamide 6	Blue and Black	10/0 to 2 USP	Non-absorbable, monofilament, synthetic, very smooth, excellent knotting properties, easy to handle, loss of tensile strength after long-term implantation

TERVALON

Intended for use in Cardiovascular, Plastic, Reconstructive, General surgery and whenever non-absorbability and low-friction passage through tissues are needed.

Composition	Colour	Range	Characteristics
Braided and coated suture made of Polyester	Green and White	6/0 to 6 USP	Non-absorbable, multifilament, synthetic, high tensile strength, no capillary effect, well tolerated by the tissue, low friction

Surgical Sutures - Non-absorbable threads

SILON braided ORSILON braided

Intended for use in Skin Closure, Subcutaneous tissue, Transversely cut muscles, Fascia, Peritoneum, Gastrointestinal Tract and Blood vessels ligation.

Composition	Colour	Range	Characteristics
Braided suture made of Polyamide	White and Black	5/0 to 5 USP	Non-absorbable, multifilament, synthetic, high tensile strength, excellent knotting properties, loss of tensile strength after long-term implantation

SILK

Intended for use in Skin Closure, Subcutaneous tissue, Fascia, Peritoneum and Gastrointestinal Tract.

Composition	Colour	Range	Characteristics
Braided and coated suture made of Silk	Blue and Black	9/0 to 5 USP	Non-absorbable, multifilament, synthetic, no capillary effect, loss of tensile strength after long-term implantation

STEEL Wire

Intended for use in Abdominal wound closure, Sternal closure, Orthopaedic procedures and Tendons.

Composition	Colour	Range	Characteristics
Monofilament suture made of 316LVM Stainless steel	Steel	1 to 7 USP	Non-absorbable, monofilament, superior steel, flexible wire, excellent tissue penetration, high tensile strength

European Pharmacopoeia

The publication of the European Pharmacopoeia (Ph. Eur.) resulted in a standardization of the classification of threads and gauges of surgical suture material.

The Ph. Eur. specifies a decimal classification and metric coding for the gauges. It quotes a thread diameter of 1/10 mm, so that the thread gauge of 3.5 has a diameter of 0.35 mm.

The following table of the gauges gives a comparison of the metric and the USP gauge coding.

EP/Metric	USP	Ø (mm)	Ø (mm) Absorbable monofilaments
0.2	10-0	0,020-0,029	
0.3	9-0	0,030-0,039

Packaging

The packaging of CTI's surgical suture material is stable, user-friendly and functional. It provides optimal mechanical and bacterial safety. The sutures are ready for use in a sterile foil or aluminium pack.

Each primary sales unit contains 24 individual packs, whereas some contain 12 individual packs (Loop sutures or Microsurgery sutures) or 20 individual packs (Chirapack sutures).

CTI short threads

Pre-cut length surgical sutures.

CTI atraumatic sutures

Pre-cut length surgical sutures, armed with a drilled end needle, ready for use. Removable needles are marked with an A behind the needle description.

CTI Chirapack

2.5 or 3 meters of suture material on a thread spool, ready for use. Each sales unit contains 20 individual packs.

How to unpack the suture - Alufoil

1. Open the non-sterile outer package

2. Transfer to sterile area

3. Tear off the opening system, indicated by the dotted line

4. Take immediate, direct hold of the needle. Pull out the suture towards the right

How to unpack the suture - Blisterfoil

1. Open the non-sterile outer package

2. Transfer to sterile area

3. Tear off the opening system, indicated by the dotted line

4. Take immediate, direct hold of the needle. Pull out the suture towards the right

Absorbable

Chirasorb rapid

chirasorb

Chirasorb
rapid

CHIRASORB rapid

CHIRASORB rapid is a short-term absorbable, coated, synthetic, multifilament suture made of 90% glycolide and 10% L-lactide. The substances contained in the coating and suture are nonantigenic and noncollagenous. Sterile Chirasorb rapid is available in violet and natural.

Absorption begins as a loss of tensile strength without appreciable loss of mass. The product elicits a minimal acute inflammatory reaction in tissues.

Progressive loss of tensile strength and absorption of Chirasorb rapid occurs by hydrolysis, when the polymer is degraded to glycolic and lactic acids, which are subsequently absorbed and metabolised by the body.

Indication: Skin closure (e.g. intracutaneous, subcutaneous), Paediatric surgery, Episiotomies, Circumcision, Closure of oral mucosa and Ophthalmic surgery for conjunctival sutures.

Contraindication: Chirasorb rapid should not be used in tissues subject to expansion, stretching or distension, or which might require long-term mechanical support.

Sizes: 6/0 to 2 USP

Structure: Multifilament

Absorption method: Hydrolysis

Strength Retention Profile: SHORT-TERM HEALING (12 days)

1 Day	100%
5 Days	50%
10-14 Days	0%

Mass Absorption profile: 42 days

Absorbable - Chirasorb rapid

Chirlac rapid

Chirlac rapid

Chirlac

Chirlac rapid

CHIRLAC rapid

CHIRLAC rapid is a short-term absorbable, coated, synthetic, multifilament suture made of low molecular weight polyglycolic acid. The substances contained in the coating and suture are nonantigenic and noncollagenous. Chirlac rapid is available in violet and natural.

Progressive loss of tensile strength and absorption of Chirlac rapid occurs by hydrolysis, where the polymer degrades to glycolic acid, which is subsequently absorbed and metabolised by the body.

Absorption begins as a loss of tensile strength without appreciable loss of mass. The product elicits a minimal acute inflammatory reaction in tissues.

Indication: Gynaecology, Ophthalmic (e.g. conjunctiva), Odontology (e.g. oral mucosa), Paediatric and Skin Closure (e.g. intracutaneous, subcutaneous).

Contraindication: Chirlac rapid should not be used in tissues subject to expansion, stretching or distension, or which might require long-term mechanical support longer than seven days. The suture is not for use in ligation, cardiovascular or neurological tissues.

Sizes: 6/0 to 4 USP

Structure: Multifilament

Absorption method: Hydrolysis

Strength Retention Profile: SHORT-TERM HEALING (12 days)

1 Day	100%
5 Days	60%
10-14 Days	0%

Mass Absorption profile: 42 days

Absorbable - Chirlac rapid

W Monolac

Monolac

Monolac

W Monolac

MONOLAC

MONOLAC is a mid-term absorbable, synthetic, monofilament suture made of glycolide and ϵ -Caprolactone, available in natural colour for the closure of superficial wounds and in violet for all other indications, when a mid-term monofilament is needed.

During absorption the material elicited only a very slight inflammation.

The material is degraded into adipic acid, which is completely metabolised in the body. The process begins with a loss of tensile strength, followed by a loss of mass at a later stage.

Indication: Soft tissue in all specialities, Skin Closure (e.g. intracutaneous, subcutaneous), Plastic, Gynaecology, Urology and Gastrointestinal surgery.

Contraindication: Monolac should not be used in tissues subject to expansion, stretching or distension, or which might require long-term mechanical support.

Sizes: 6/0 to 2 USP

Structure: Monofilament

Absorption method: Hydrolysis

Strength Retention Profile:

MID-TERM HEALING (30 days)	
1 Day	100%
7 Days	60% violet/50% natural
14 Days	30% violet/20% natural

Mass Absorption profile: 90 - 120 days

Chirasorb

CHIRASORB

CHIRASORB is a mid-term absorbable, coated, synthetic, multifilament suture made of 90% glycolide and 10% L-lactide. The substances contained in the coating and suture are nonantigenic and noncollagenous.

Sterile Chirasorb is available in violet or natural. The product elicits a minimal acute inflammatory reaction in tissues.

Progressive loss of tensile strength and absorption of Chirasorb occurs by hydrolysis, when the polymer is degraded to glycolic and lactic acids, which are subsequently absorbed and metabolised by the body.

Indication: General surgery, Gynaecology, Ophthalmic, Skin Closure (e.g. intracutaneous, subcutaneous), Muscular layer and Ligation.

Contraindication: Chirasorb should not be used in tissues subject to expansion, stretching or distension, or which might require long-term mechanical support.

Sizes: 10/0 to 6 USP

Structure: Multifilament

Absorption method: Hydrolysis

Strength Retention Profile: MID-TERM HEALING (35 days)

1 Day	100%
14 Days	75%
21 Days	50%

Mass Absorption profile: 56 - 70 days

CHIRASORB violet ligatures

Absorbable - Chirasorb

CHIRASORB Plus

Antibacterial

CHIRASORB Plus is a mid-term absorbable, antibacterial coated, synthetic, multifilament suture made of 90% glycolide and 10% L-lactide. The braided suture is covered with antibacterial coating, which consists of copolymer glycolide and lactide, calcium stearate and chlorhexidine diacetate.

Chlorhexidine is a cationic antiseptic with a wide range of antimicrobial effects. It is effective on both Gram-positive and Gram-negative bacteria; the mechanism of action is cytoplasmic membrane disruption.

Sterile Chirasorb Plus is available in violet or natural. The product elicits a minimal acute inflammatory reaction in tissues.

Progressive loss of tensile strength and absorption of Chirasorb Plus occurs by hydrolysis, when the polymer is degraded to glycolic and lactic acids, which are subsequently absorbed and metabolised by the body.

Indication: General surgery, Gynaecology, Skin Closure (e.g. intracutaneous, subcutaneous), Muscular layer and Ligation.

Contraindication: Chirasorb Plus should not be used in tissues subject to expansion, stretching or distension, or which might require long-term mechanical support. Chirasorb Plus should not be used in patients with known allergic reactions to Chlorhexidine.

Sizes: 6/0 to 4 USP

Structure: Multifilament

Absorption method: Hydrolysis

Strength Retention Profile: MID-TERM HEALING (35 days)

1 Day	100%
14 Days	75%
21 Days	50%

Mass Absorption profile: 56 - 70 days

Chirlac

Chirlac

Chirlac

Chirlac

CHIRLAC

CHIRLAC is a mid-term absorbable, synthetic, multifilament suture material of extremely high tensile strength made of the homopolymer of hydroacetic acid (glycolic acid).

The thread has a homogeneous structure and surface, which gives it low frictional properties and holds firmly without slipping when knotted.

Chirlac is coated with an absorbable substance, which reduces the capillary effect, provides excellent holding properties and diminishes the tendency to cut into the flesh, while ensuring that the knots hold firmly.

Chirlac is degraded in the body by a simple hydrolytic process. The degraded products are metabolised completely in the body. Absorption begins as a loss of tensile strength without appreciable loss of mass.

Indication: General surgery, Gynaecology, Ophthalmic, Skin Closure (e.g. intracutaneous, subcutaneous), Muscular layer and Ligation.

Contraindication: Chirlac should not be used in tissues subject to expansion, stretching or distension, or which might require long-term mechanical support.

Sizes: 9/0 to 6 USP

Structure: Multifilament

Absorption method: Hydrolysis

Strength Retention Profile: MID-TERM HEALING (28 - 35 days)

1 Day	100%
14 Days	65% - 75%
21 Days	45% - 50%

Mass Absorption profile: 80 - 90 days

POLYDOX

POLYDOX is a long-term absorbable, synthetic, monofilament suture made of polydioxanone. The suture offers good handling combined with great strength due to its slow degradation profile.

Polydox is ideal for all indications, where an extended wound support of more than 4 weeks is desirable. The threads are available in violet and natural.

The suture is very flexible, pliable and easy to knot. In tissue, the thread can cause a slight initial inflammatory reaction.

Indication: General soft tissue approximation, Orthopaedics (e.g. Joint capsule, Tendons), Fascia Closure, Urology, Gynaecology and Plastic surgery.

Contraindication: Polydox should not be used where prolonged approximation of tissues under stress is required.

Sizes: 7/0 to 4 USP

Structure: Monofilament

Absorption method: Hydrolysis

Strength Retention Profile: LONG-TERM HEALING (90 - 98 days)

1 Day	100%
45 Days	50%

Mass Absorption profile: 180 - 240 days

CHIRAFLON

CHIRAFLON is a non-absorbable, monofilament suture made of PVDF (similar to teflon). Physiologically this thread is completely inert.

Chiraflon offers optimal smoothness and superior knotting properties. The thread is characterised by its high tensile strength. No splitting occurs even under considerable strain.

Indication: All surgical specialities, especially Cardiovascular, Plastic, Reconstructive, Ophthalmic, Orthopaedic and Traumatology (e.g. tendons).

Contraindication: Chiraflon must not penetrate into the inner parts of the digestive and urinary tracts.

Chemical Composition: Polyvinylidene Fluoride (PVDF)

Sizes: 8/0 to 3 USP

Structure: Monofilament

Absorption method: Non-absorbable

Colour: Blue

Non-absorbable - Chiraflon

CHIRALEN

CHIRALEN is a non-absorbable, monofilament suture made of polypropylene. The thread is hydrophobic and is not subject to degradation by tissue enzymes.

Chiralen has a smooth, non-porous surface, that guarantees a clean and smooth passage through the tissue, optimal elasticity, good elongation properties and high visibility. In tissues, it can cause a minimal acute inflammatory reaction.

Indication: All surgical specialities, especially Cardiovascular, Plastic, Reconstructive, Ophthalmic, Orthopaedic and Traumatology (e.g. tendons).

Contraindication: Chiralen must not penetrate into the inner parts of the digestive and urinary tracts.

Chemical Composition: Polypropylene

Sizes: 10/0 to 2 USP

Structure: Monofilament

Absorption method: Non-absorbable

Colour: Blue and Black

SILON monofilament

SILON monofilament is a non-absorbable, synthetic suture made of polyamide, which has a smooth non-porous surface.

The thread is extremely useful for skin sutures and has a high tensile strength in knots, and knots tie down easily. The thread is available in blue and black.

Silon monofilament can cause a slight initial inflammatory tissue reaction.

Indication: Skin Closure (e.g. intracutaneous, subcutaneous), Plastic, General, Reconstructive and Ophthalmic surgery.

Contraindication: Silon monofilament should not be used when long-term mechanical support is required.

Chemical Composition: Polyamide 6

Sizes: 10/0 to 2 USP

Structure: Monofilament

Absorption method: Non-absorbable

Colour: Blue and Black

Tervalon
Tervalon
Tervalon
Tervalon

TERVALON

TERVALON is a braided, polyester suture material with a special coating, which guarantees effortless tissue passage and excellent knot-tying characteristics.

The extreme tensile strength and tissue compatibility are further positive characteristics of Tervalon, which is used in all areas of surgery due to its favourable features.

Tervalon is applicable wherever non-absorbability and low-friction passage through tissues are needed.

The suture elicits a minimal inflammatory reaction in tissues, which is followed by gradual encapsulation of the suture by fibrous connective tissue.

Indication: Cardiovascular, Plastic, Reconstructive and General surgery.

Contraindication: Tervalon must not penetrate into the inner parts of the digestive and urinary tracts.

Chemical Composition: Polyester

Sizes: 6/0 to 6 USP

Structure: Multifilament

Absorption method: Non-absorbable

Colour: Green and White

SILON braided/ORSILON braided

SILON braided/ORSILON braided are non-absorbable, multifilament sutures made of polyamide. Braided sutures made of polyamide have excellent tissue biocompatibility, minimal resistance to tissue passage and high knot security. The sutures are characterized by a strong knot-pull strength.

Characteristics of Orsilon braided are higher tensile strength, lower extension, reduced capillary effect and a smoother surface.

The sutures elicit a minimal initial inflammatory reaction in tissues, which is followed by gradual encapsulation of the sutures by fibrous connective tissue.

Indication: Skin closure, Subcutaneous tissue, Transversely cut muscles, Fascia, Peritoneum, Gastrointestinal tract and Blood vessels ligation.

Contraindication: Silon braided/Orsilon braided should not be used for suturing infected wounds. It should not be used when long-term mechanical support is required.

Chemical Composition: Polyamide

Sizes: 5/0 to 5 USP

Structure: Multifilament

Absorption method: Non-absorbable

Colour: White and Black

Silk

SILK

SILK is a natural and non-absorbable, multifilament suture material. To give Silk a certain stiffness a special technology is applied.

The braided suture is stiffened by inserting a twisted stem from the same material. The Silk is coated to achieve water resistance and avoid its high capillary effect.

Silk is characterised by its constant thread diameter and high tensile strength. The advantages of Silk sutures are their extreme pliability, ease of handling and excellent knot strength.

Indication: Skin Closure, Subcutaneous tissue, Fascia, Peritoneum and Gastrointestinal Tract.

Contraindication: Silk should not be used for suturing infected wounds. Silk cannot be used when permanent suture stability is required.

Chemical Composition: Natural silk

Sizes: 9/0 to 5 USP

Structure: Multifilament

Absorption method: Non-absorbable

Colour: Black and Blue

SILK black ligatures

Steel Wire

STEEL Wire

STEEL Wire is a non-absorbable, monofilament and sterile surgical suture composed of 316LVM stainless steel for surgical implants. Steel Wire material is supplied as combinations of stainless steel needles.

Steel Wire sutures are the most inert of all suture materials and provide maximum tensile strength. Steel Wire is available with fixed or rotating (axial) needles. All boxes are supplied in long packs.

Indication: Abdominal wound closure, Sternal closure, Orthopaedic procedures and Tendons.

Contraindication: Steel Wire is contraindicated in patients with known sensitivities or allergies to steel and/or its principal metallic components, such as chromium and nickel. The presence of steel may interfere with certain radio-diagnostics and its use is contraindicated where radiotransparency of suture material is required.

Chemical Composition: 316LVM Stainless steel

Sizes: 1 to 7 USP

Structure: Monofilament

Absorption method: Non-absorbable

Colour: Steel

Fix-clip

Fix-clip Cat. No. FS 0030

Intracutaneous suture with Fix-clip for an optimal cosmetic result.

Pierce the skin at two points only

No suture knots

Fixation with two clips

Easy to remove after wound healing: simply cut off one of the clips

Easy suture removal by pulling out the second clip

For threads EP 1-2 (USP 5/0-3/0)

Minimal invasive surgery

Eye-needles

Surgical Eye-needles are made of high-quality stainless steel. Different types of needles are available to meet a full range of requirements. The needles are always packed in foil pouches with 12 pieces.

The surgical Eye-needle range consists of Eye-needles with a double spring eye and with a regular eye.

Chiralen Meshes

Capromesh
Chiralen
Capromesh

Surgical Meshes

Surgical Meshes have become standard for the repair of abdominal wall hernias. Surgical mesh is a sterile woven material designed for permanent implantation within the body during open or laparoscopic procedures.

A wide range of mesh implants are available, with two main functions: to stabilise and strengthen soft tissue defects, and to act as a sling to support prolapsed organs and viscera. In tissue repair applications, the mesh serves to mechanically strengthen the weakened area whilst simultaneously promoting long-term stability by acting as a scaffold for new tissue growth. It is most commonly used in pelvic organ prolapse, urinary stress incontinence and hernia repairs.

CAPROMESH meshes

Partially absorbable

The sterile, partially absorbable, composite mesh is made from two components: one absorbable and one non-absorbable.

Capromesh is composed of an absorbable segmented copolymer of glycolide and ϵ -caprolactone and non-absorbable polypropylene monofilament fibres. The monofilament structure of the mesh decreases the risk of infection and inflammation.

After absorption of the absorbable part, only the polypropylene mesh remains in the body. The structure and size of the residual mesh are optimally designed for the physiological stress to which the abdominal wall is subject.

Indication: Capromesh is indicated in the operative treatment of weakened abdominal wall and fascial defects - in particular hernias, the healing of which requires long-term bridging or strengthening of the damaged structures..

Technical information

Fibre thickness: Approx. 500 μ m

Pore size: 2 - 4 mm

Weight: Initial: approx. 85 g/m². PP - contents approx. 28 g/m²

Stiffness: Initial: approx. 20 mg. After absorption: approx. 1 mg

Burst strength of the mesh: Initial: approx. 300 N. After absorption: approx. 175 N

Absorption time: PGA/PCL part: approx. 90 - 120 days

Advantages

Advantages for the surgeon:

- Low inflammation risk due to monofilament structure
- Mesh can be cut into any shape and remains stable
- Optimal and safe handling during surgery
- Suitable for all operation techniques
- Made from proven materials: Monolac (PGA/PCL) and Chiralen (PP)
- Good balance between price and quality

Advantages for the patient:

- Lower risk of infection
- Minimal foreign body component after partial absorption
- Optimal elongation in both directions
- Maximal comfort for the patient due to optimal softness
- Residual weight of the PP-net is only 25 g/m²

Size	Cat. No
6 cm x 11 cm	PC 0611
10 cm x 15 cm	PC 1015
15 cm x 15 cm	PC 1515
15 cm x 30 cm	PC 1530
30 cm x 30 cm	PC 3030

CHIRALEN meshes

CHIRALEN meshes light

CHIRALEN meshes

Non-absorbable

The sterile and surgical meshes are made from undyed polypropylene filaments. The knitted filaments have a smooth and hydrophobic surface, which biologically are absolutely inert. High elasticity in both directions guarantees good elasticity and flexibility. This construction enables the mesh to be cut to any shape or size without unravelling. The meshes' tensile strength and tear resistance are in line with the natural properties of the body, so the meshes can be used for various indications. The special structure, increased pore size and particularly fine monofilaments provide a macroporous, very light and flexible mesh implant. Its greater porosity allows more rapid ingrowth of the body's cells, which stabilises the tissues.

The mesh can be fixed in the location of the wound. For this purpose non-absorbable suture material should be used at a distance of at least 6.5 mm from the edge of the mesh.

Chiralen meshes are available in different sizes, all offering high strength and high flexibility. Chiralen meshes are available in a weight of approx. 125 g/m² or in the light version with a weight of approx. 55 g/m².

Indication: Chiralen meshes are indicated in the operative treatment of fascial defects, in particular hernias, which require long-term bridging of damaged structures.

Technical information - Chiralen mesh

Weight: 125 g/m²

Thickness of filament: 0.420 mm

Pore density: 48 pores/1 cm²

Technical information - Chiralen mesh light

Weight: 55 g/m²

Thickness of filament: 0.320 mm

Pore density: 48 pores/1 cm²

Pore size gross: 218 µm
(net: 180 µm)

Advantages:

- Minimises foreign-body reactions
- Security combined with great comfort for the patient
- Optimised scar tissue formation

The CTI group

The CTI group

A constellation of 3 European manufacturers of high quality products for the healthcare sector

The CTI group consists of: CHIRANA T. Injecta in Slovakia, CHIRANA T. Injecta in Czech Republic and Vitrex Medical in Denmark.

The intention of CTI group is to serve as an “umbrella-organization”, where the individual companies collaborate to be “Committed to Innovation” and reach the joint goal:
- to develop, produce and distribute high quality, healthcare products.

CHIRANA T. Injecta, Slovakia

CHIRANA T. Injecta is a global, state of the art manufacturer of healthcare products, which was founded in 1935.

In 1947 CHIRANA T. Injecta started manufacturing glass syringes and they have ever since focused on development and production of high quality, disposable products for the healthcare sector. Through continuously updating production facilities and expanding their product range, they are today supplying:

- Hypodermic syringes
- Perfusion syringes
- Pen and Blood collection needles
- Insulin syringes
- Cannula and lancet needles

CHIRANA T. Injecta, Czech Republic

CHIRANA T. Injecta was founded in 1930. Since the early 1990s they have made substantial investments in upgrading the production resources, enabling the company to offer products in an unique quality.

Their more than 85 years of experience with manufacturing sutures has resulted in top priority within quality control, product development and sutures manufactured in line with state of the art technology. Their present range consist of:

- Surgical Sutures, Ligatures and Meshes
- Veterinary bottles and Eye-needles
- Microsurgery and Cardiovascular sutures
- Antibacterial sutures

VITREX Medical, Denmark

Vitrex Medical was founded in 1965 and has since the 1970s mainly focused on supplying to the laboratory and analytical sector.

With more than 50 years of experience Vitrex Medical has become the largest manufacturer of capillary tubes in the world today by developing equipment, establishing technologies, and optimizing production processes. Vitrex Medical currently supplies:

- Capillary tubes and Micro-Hematocrit tubes
- Micro-pipettes
- Safety lancets
- Vacuum tubes and Blood collection needles
- Pen needles and Diabetic lancets
